

$B = 170$

A simulation showing a dense, well-ordered hexagonal lattice of particles. The particles are represented as small blue dots with a white halo, set against a dark red background. The lattice is uniform and fills the entire frame.

$B = 175$

A simulation showing a hexagonal lattice of particles. The lattice is slightly less dense than at B=170, but the overall hexagonal arrangement is still clearly visible.

$B = 180$

A simulation showing a hexagonal lattice of particles. The density is further reduced, and the lattice appears slightly more distorted, though the hexagonal pattern remains discernible.

$B = 185$

A simulation showing a hexagonal lattice of particles. The density is significantly lower, and the lattice structure is becoming more sparse and irregular.

$B = 190$

A simulation showing a hexagonal lattice of particles. The density is very low, and the lattice structure is highly irregular and sparse.

$B = 195$

A simulation showing a hexagonal lattice of particles. The density is extremely low, and the lattice structure is almost completely lost, with only a few scattered particles visible.
